# 01

# Problem

**People accept agreements they don't understand.**

- Legal contracts are long, dense, and hard to understand.
- Users don't know which clauses matter.
- And if a problem arises, they don't remember what they agreed to, what rights they have, what actions they can take, or who is ultimately liable.

## 02

# Market Gap

**Existing legal tools aren't built for individuals.**

- Legal tools focus on professionals/enterprises
- Consumers need simple risk signals + plain language
- Trust requires privacy-first handling

# Our Solution

**Agreemind helps users manage the entire lifecycle of their legal agreements.**

**Users can:**

- Get a plain-language summary
- See “risk flags” and the clause that triggered them
- Be aware of their rights and actions they are entitled to
- Save to a personal document vault for later search and version tracking
- Compare similar documents for hidden differences and implications

# Project Healthcard

Schedule		Gained momentum.
Cost		Found success with small models.
Scope		How many domains / jurisdictions to support?
Risks		Need legal expertise for legal grounding.

# What We Have Achieved

- Initial web and mobile UI
- Core analysis functionality (risk classification using a custom model, rights and time-sensitive clause extraction)
- Document and vault querying
- Document history and compare between versions

# Future Goals

- Completing and improving user interfaces
- Generalization into other domains (Rental, Banking, Insurance etc.)
- Legal grounding / Compliance checking
- Local-only settings for advanced privacy
- Browser extension
- Improve the accuracy/performance of already existing features.

# 10 Team Contributions

**Ata Oğuz:** Backend development, Querying

**Ata Soykal:** Frontend development

**Can Polat Bülbül:** Model training for risk classification

**Edip Emre Dönger:** Development of analysis pipeline

**Emir Görgülü:** Backend development, Version history

# Demo Environment

- All components (frontend, backend, PostgreSQL database) are dockerized and run locally.
- Risk classification model is fetched from HuggingFace, and ran locally.
- Summarization, Q&A etc. are done using LLM APIs. (They will also be localized in the future.)
